Concerning: prefilled pressure tanks

Dear Customer,

In our continuous effort to further improve the quality of our products, we are implementing the following modification on all complete systems that have a separate pressure tank with diam. 10" or 12" (ProFlow, MultiMix, NoNitrate).

Currently the resin is delivered separately, meaning that the pressure tank needs to be filled on-site during installation. We have decided that all pressure tanks with a diameter 10" and 12" will be prefilled with the resin in our factory. Furthermore the control valve will be installed onto the pressure tank, meaning the system comes completely pre-assembled, ready-for-installation! Not only this greatly simplifies installation and reduces the required installation time, it also reduces the packaging dimensions. This pressure tank & control valve assembly will come packed in a custom-made heavy-duty carton box that offers optimal protection to the system during transport and stocking.

Currently the above is already the case for our iron/manganese removal filters (Oxydizer) and pH neutralizers.

This modification will be introduced in our systems assembly as of today.

Please do not hesitate to contact our sales team if you need any additional information on this topic.
